Organ Transplantation

Organ transplantation

Organ transplantation is the moving of an organ from one body to another or from a donor site to another location on the person's own body, to replace the recipient's damaged or lost organ. Organs and/or tissues transplanted within the same person's body are called autografts. Transplants performed between two subjects of the same species are called allografts, which can be from either living or cadaveric source.

Organs that can be transplanted are hearts, kidneys, livers, lungs, pancreas, intestines and thymus. Transplanted tissues include bones, tendons, corneas, skins, heart valves, nerves and veins. Kidneys are the most commonly transplanted organs worldwide, followed by livers and then hearts. Cornea transplantation and musculoskeletal graft are the most commonly tissue transplantations which outnumber organ transplantations by more than tenfold.

Transplantation medicine is one of the most challenging and complex areas of modern medicine. A key problem in medical management area is transplant rejection, during which the body has an immune response to the transplanted organ, possibly leading to transplant failure and the need to immediately remove the organ from the recipient. When possible, transplant rejection can be reduced through serotyping to determine the most appropriate donor-recipient match and through the use of immunosuppressant drugs.
