Cytokines

ELISA Kits for Cytokines

• Cytokines

Cytokine is a class of small proteins (5-20kDa) that are important in cell signaling. Their release has an effect on the behaviour of cells around them. Cytokines are involved in autocrine signaling, paracrine signaling and endocrine signaling as immunomodulating agents. Their definite distinction from hormones is still an ongoing research. Cytokines include chemokines, interferons, interleukins, lymphokines and tumor necrosis factors but generally not hormones or growth factors (despite some overlap in the terminology). Cytokines are produced by a broad range of cells, including immune cells like macrophages, B lymphocytes, T lymphocytes and mast cells, as well as endothelial cells, fibroblasts and various stromal cells.

Cytokine is important in health and disease research, specifically in host response to infection, immune response, inflammation, trauma, sepsis, cancer and reproduction.
